2025 Economic Outlook: Less of the Same

By Steven P. Lanza Associate Professor-in-Residence, UConn Department of Economics

he Covid pandemic took the world, the country and the state on an economic rollercoaster ride: a precipitous decline in output and jobs veered into an equally stunning recovery of production and employment. While progress has decelerated since the years immediately following the pandemic, some growth is expected to continue in 2025 even as central banks keep a watchful eye on inflation.

The Global Economy

The International Monetary Fund (IMF) projects that global growth will hold steady at 3.2% in 2025 but that falls short of its 3.4% two-decade average. The IMF outlook hinges on several assumptions, including falling commodity prices and easier money. Oil prices are expected to drop from over \$80 per barrel in 2024 to about \$73 in 2025 thanks to strong non-OPEC supply growth, and food prices are expected to fall nearly 5% following an anticipated record-high global grain harvest. Except for Japan, where monetary policy remains exceptionally accommodative, the IMF also expects major central banks to continue to ease interest rates in 2025, although rates in the U.S. are anticipated to remain higher than in the Euro zone. Major economies are largely expected to exercise fiscal restraint in the new year.

As usual, however, the topline projection for global growth conceals a divergence between the emerging and developed worlds. The slower-growing advanced

economies, including the United States and Western Europe, are expected to average 1.8% GDP growth in 2025, a repeat of 2024's growth rate and essentially matching the 20-year average. In the faster-growing emerging markets and developing economies, growth is expected to ease slightly, from 4.4% in 2023 to 4.2% in both 2024 and 2025. These economies typically see growth rates closer to 5% annually.

Though the overall average growth rate in advanced economies is projected to hold steady, growth rates in individual countries are expected to show more convergence toward the mean. Canada and the U.S. are expected to lead the way with 2.4% and 2.2% real growth in 2025, respectively. For Canada, that is an improvement over the projected 1.3% increase in 2024 as lower interest rates boost interestsensitive household consumption and residential investment alike. In the U.S., growth is down from a projected 2.7% in 2024 as a slowing jobs market keeps household consumption in check. Real growth in the Euro area is expected to rise to 1.2% in 2025, up from 0.8% in 2024 and 0.4% in 2023 thanks to improved export performance, rising wages that will fuel domestic consumption, and falling interest rates that should spur business investment.

While growth among emerging markets and developing economies will ease slightly in 2025, it will still outpace that of the advanced economies. Faster growth in Latin America, the Middle East, Central

ECONOMIC DIGEST

The Connecticut Economic Digest is published monthly by the Connecticut Department of Labor, Office of Research, and the Connecticut Department of Economic and Community Development. Its purpose is to regularly provide users with a comprehensive source for the most current, up-to-date data available on the workforce and economy of the state, within perspectives of the region and nation.

The annual subscription is \$50. Send subscription requests to: *The Connecticut Economic Digest*, Connecticut Department of Labor, Office of Research, 200 Folly Brook Boulevard, Wethersfield, CT 06109-1114. Make checks payable to the Connecticut Department of Labor. Back issues are \$4 per copy. The Digest can be accessed free of charge from the DOL Web site. Articles from *The Connecticut Economic Digest* may be reprinted if the source is credited. Please send copies of the reprinted material to the Managing Editor. The views expressed by the authors are theirs alone and may not reflect those of the DOL or DECD.

Managing Editor: Jungmin Charles Joo Associate Editor: Erin C. Wilkins

We would like to acknowledge the contributions of many DOL Research and DECD staff and Rob Damroth to the publication of the Digest.

Asia, and Africa is expected to counterbalance a modest slowdown in emerging and developing Asia and Europe. Despite surprisingly strong exports in China, the ongoing slump in that country's real estate sector is expected to reduce growth from 4.8% in 2024 to 4.5% in 2025. And in India, where the post-pandemic surge in consumer spending is expected to have run its course, growth will edge down from 7.0% to 6.5%.

The U.S. Economy Outperforms Expectations

The U.S. economy, which likely grew at a 2.7% annual rate in 2024, significantly outperformed expectations as the consensus heading into the year was that real output would rise by only about 1.5%. Analysts are again predicting a slowdown in U.S. economic performance but are a bit more bullish than at the same time last year. The IMF's prediction of 2.2% real GDP growth for the U.S. in 2025 is not far off the mark of other forecasters. Analysts participating in the Federal Reserve Bank of Philadelphia's latest Survey of Professional Forecasters (SPF) concur with the IMF and expect U.S. growth to clock in at 2.2%. Goldman-Sachs has one of the more upbeat outlooks for the U.S., predicting 2.5% growth, but others are a bit less sanguine. Forecasters surveyed by the Wall Street Journal expect 1.9% growth in 2025 while the Conference Board anticipates growth of just 1.7%. Similarly, S&P Global (formerly IHS-Markit) calls for 2.0% growth in its baseline outlook while the Deloitte Global Economics Research Center sets its baseline at just 1.5%. Both forecasting groups bracket their outlooks with an optimistic and a pessimistic scenario. For S&P the range covers a fairly broad band of 2.9% to 0.4% growth. For Deloitte, the range is a quite narrow one of between 1.9% and 1.0%. Note, however, even the pessimistic scenarios keep growth in positive territory.

Household consumption accounts for 70% of U.S. GDP, and consumer spending which was surprisingly brisk in 2024 will

remain strong in 2025. Real consumer spending on goods and services rose by a projected 2.7% in 2024 and should, according to the S&P forecast, advance another 2.6% in 2025. Households have essentially exhausted the nearly \$2 trillion in extra savings they accumulated during the pandemic, so increased spending will require more borrowing, more income, or more of both. Continued easing by the Fed will lower interest rates and improve credit conditions allowing households to take on more debt. Meanwhile, income growth will support more out-ofpocket spending. Hourly compensation is expected to rise by 4.7% in 2025, compared with 4.0% in 2024, while CPI inflation is projected to fall from 2.9% in 2024 to 2.1% in 2025. And consumer sentiment is increasingly upbeat. After dropping by half during Covid and the immediate post-pandemic period, the University of Michigan's consumer sentiment index has been clawing its way back up, rising by 11% in both 2023 and 2024, a pace it is expected to maintain in 2025.

Business investment (net of housing) represents another 15% of U.S. GDP but it is a more volatile component of domestic output. Investment growth is expected to slow from 3.7% in 2024 to 2.1% in 2025 as spending on nonresidential structures flattens out. This investment sub-sector has been hobbled by high office vacancy rates in the post-Covid period, which have put a damper on commercial real estate construction. But nonresidential construction got a big boost in 2022 from the Inflation Reduction and CHIPS and Science Acts which created generous incentives to invest in electric vehicles, renewable energy, semiconductors and other cuttingedge technologies. The incentives led to an 11% jump in nonresidential structure investment in 2023 as businesses built new production facilities, but growth slowed to just 3.4% in 2024 and is projected to remain flat in 2025 as the initial surge from the legislation runs its course. New facilities require new equipment,

CONNECTICUT

however, so investment in business equipment which increased by 3.7% in 2024 is expected rise by another 3.6% in 2025. Investment in intellectual property products—including entertainment, software, and research and development—is expected to slow a bit but remain positive. Covid placed a premium on the development of technologies to support remote work, and the advent of artificial intelligence will continue to support intellectual property investments.

New homes, perhaps the largest single purchase that households will make, are technically classified under investment spending. As a particularly interest-sensitive sector of the economy, the housing market has been chilled by high mortgage rates under the current tight-money environment. While falling rates will herald a thaw in the industry, real improvement may have to wait until after 2025 because lower interest rates take time to have their full effect, and aggressive rate cuts won't come until inflation subsides further. Housing starts have declined over the last several years and were down 5.0% in 2024 after dropping 8.4% in 2023. Starts may decline further in 2025, but according to S&P, only on the order of 1.0%. Meanwhile, the tight supply is contributing to rising home prices. In 2024 the average price of new homes rose 0.2% and existing home prices advanced 3.9%. The S&P forecast calls for price increases of 0.4% for new homes and 2.6% for existing homes in 2025.

The long-running U.S. trade deficit, currently less than 3% of GDP, belies the importance of trade to the nation's economy as the sum of U.S. exports and imports of goods and services represents nearly 25% of total output. Though the U.S. routinely runs a deficit in goods trade, it runs a surplus on the services side of the ledger. Exports of goods and services grew by 2.8% in 2023 and 3.5% in 2024. Meanwhile, imports dropped 1.2% in 2023 but then advanced 5.8% in 2024. Exports are expected to grow again in 2025, by 4.0%, while

imports are expected to rise by 5.3%. Net exports (exports less imports) added about a half point to U.S. GDP growth in 2023 but trimmed a similar amount off growth in 2024. Net exports are again expected to reduce GDP growth in 2025 by a half point or more. The real wild card is the effect of possible new tariffs on trade. Nominally, tariffs would reduce imports and improve the balance of trade. But if new tariffs lead to retaliatory measures by U.S. trading partners, our exports would suffer as would the trade balance. What's more, tariffs would increase the price of imported consumer goods and raise the cost of production for firms that rely on inputs from abroad.

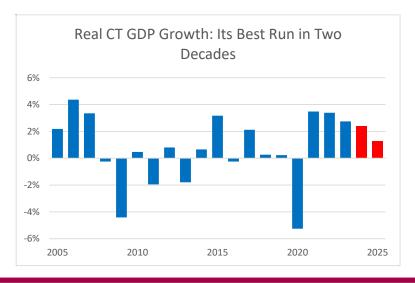

The Federal Reserve's two-year assault on rising prices has had its intended effect as the topline inflation number dropped while the labor market cooled considerably. Inflation hit a decades-high 9% in mid-2022, prompting the Fed to raise interest rates from nearly zero to between 5.25% and 5.50% over the course of 2022 and 2023. With annual price increases contained to between 2% and 3%, the Fed started lowering rates in September 2024. Though the prospect of higher tariffs has muddied the water, most forecasts anticipate that inflation will reach the Fed's 2% target in 2025. Until it does, the central bank is committed to pursuing a very measured pace of further rate reductions.

The cooling labor market has made the Fed's job a bit easier. Nonfarm job growth slowed from a

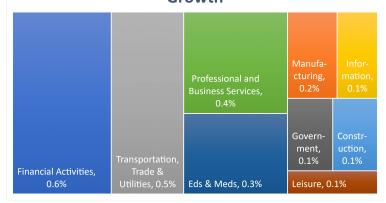

4.3% annual rate in 2022 to 2.3% in 2023 and 1.6% in 2024. The unemployment rate inched up too, from about 3.5% at the beginning of 2023 to over 4.0% at the end of 2024. And the ratio of job openings to unemployed workers fell from a high of 2:1 in early 2022 to about 1:1 in mid- to late-2024. These moderating labor market conditions have eased upward pressure on wages. The annual growth in average hourly earnings slowed from a high of nearly 6% in 2022 to about 4% in late 2024. And with annual worker productivity growth at 2% or more, wage costs are now rising at a rate consistent with the Fed's inflation target. The 2025 outlook calls for the cooldown to continue. IHS forecasts a further reduction in the rate of job growth, to 0.8%, and an increase in the unemployment rate to about 4.5%.

The Connecticut Economy

In Connecticut, state GDP has been markedly strong (chart below). The state's output of real goods and services, which has only grown at an average annual rate of 0.3% over the last 20 years, increased at a brisk 2.4% pace in 2024 according to S&P Global projections. And that follows 2.7% real growth in 2023, and 3.4% growth in 2022. Growing productivity is the driving force behind the output gain, as the 2.4% increase in real GDP reflects a 0.8% increase in employment and a 1.5% increase in output per worker. On a sectoral basis, financial activities made the greatest contribution to output growth,

Industry Contributions to 2024 Real CT GDP Growth

accounting for 0.6 points of the 2.4point gain (chart above). The trade, transportation and utilities sector was close behind, adding another 0.5 points to output growth despite a 0.6% decrease in jobs, thanks entirely to a 4.0% increase in productivity.

For Connecticut, the more restrained national labor market has produced a similar slackening in state job gains. Annual job growth slowed from about 26,000 in 2023 to about 14,000 in 2024, or from a 1.6% rate of increase to 0.8%. Despite the slowdown, 2024 was a better-thanaverage year for job growth in Connecticut as the state typically adds about 10,000 positions annually (+0.6%) when it is on an upswing. The state even flirted briefly with crossing its 2008 pre-Great Recession high water mark before job growth sputtered later in the year, although analysts at the state Department of Labor suspect that post-Covid changes in the seasonal pattern of job gains may explain strong job growth in the first half of the year followed by a weaker second half. Nevertheless, the payroll count remains above its 2020 pre-pandemic

As in 2023, the state added more jobs in education and health care on an annual average basis during 2024, about 11,000, than in any other major economic sector. The lion's share of those jobs, 8,500, were added in health care, the remaining 2,500 in education. Also in the mix: leisure and hospitality which gained about 2,700 jobs in 2024, mostly in accommodation and food services. Jobs in professional and business

services slipped by about 1,700 owing to cuts in administrative and support and waste management services. But jobs in professional, scientific and technical services and in the management of companies were up by a combined total of nearly 700. Financial activities also gained about 600 jobs. The big job loser was the state's retail trade sector, down about 3,000. Manufacturing lost barely 100 jobs as gains in durable goods production nearly offset losses in the nondurable goods subsector.

Even as job gains slowed, the unemployment rate hit a 23-year low of 3.0% late in 2024 signaling that workers remain in short supply. While there have been some fluctuations, the state's labor force participation rate has been in secular decline as the population ages. The labor force participation rate is the labor force as a percent of the population aged 16 and over with no upward cap. As more people have been living into their 80s, 90s, and beyond, the labor force participation rate has declined because those age groups are less likely to participate in the labor market. The number of job openings, though drifting lower, is again climbing relative to the number of jobless workers. Late in 2023 Connecticut employers were offering only as many jobs as there were people unemployed but in late 2024 openings once again outnumbered job seekers by a ratio of 5 to 4.

To attract and retain workers, employers have offered wage

increases that exceed the rate of inflation. On average, real wages increased by a projected 2.4% in 2024. With only isolated exceptions, real wages are up across all industries led by arts, entertainment and recreation which posted an 11.1% increase. Other top gainers included management of companies and enterprises (+7.1%), information (+4.2%), finance (+4.0%), construction (+3.8%), and manufacturing (+3.7%). Only in real estate, transportation and warehousing, and educational services did nominal wage increases fail to outpace the rate of inflation.

So, will Connecticut's jobs, wages and output continue to rise in 2025? The Fed has indicated it will keep a tighter rein on monetary policy than was expected just a few short months ago so the national slowdown will almost certainly extend into the new year. Given that Connecticut payrolls were flat in late 2024, the state would do well to add 5,000 jobs over the course of 2025—about half the number seen in a typical growth year. S&P Global concurs and is forecasting just 4,600 new jobs for the state. S&P also anticipates that inflation will cool to 2.3% in 2025, so its forecasted 3.9% average nominal wage increase for Connecticut workers would translate into a 1.6% real gain, down from 2.4% in 2024. S&P also projects a similar-sized deceleration in real state GDP from 2.4% in 2024 to 1.3% in 2025 which is still notably faster than the average growth rate over the past 20 vears.

Expect health care to again be the big job gainer and retail trade the big job loser. S&P anticipates that Connecticut will see nearly 6,000 new health care jobs in 2025 but 3,000 fewer retail trade positions. (Yale Health's plan to convert the old Macy's store at the Meriden Mall into an outpatient center is a clear sign of the times.) Leisure and hospitality is positioned to add nearly 2,000 jobs in 2025, almost all of them in accommodation and food services. Financial activities will continue building back, too, but the anticipated 1000-job increase will be neutralized by a similar-sized

decrease in professional and business services jobs.

The labor force participation rate is expected to continue its descent, and the actual size of the labor pool is expected to shrink as older workers age out of the labor force. The limited availability of workers together with continued increases in productivity will provide the impetus behind additional wage increases in 2025. S&P forecasts a slight decline in real wage growth, from 2.4% in 2024 to 1.6% in 2025 with pay in key industries including information, financial activities, and professional and business services slated to rise by about that average rate. By contrast, wages in leisure and hospitality will barely keep pace with inflation, while manufacturing, which won't see much if any job growth, will nevertheless post an above-average

2.3% increase in real wages. Hiring in manufacturing has been offset by retirements leading to little top-line job growth even as an average of 3,000 Connecticut workers start a new manufacturing job each month. Productivity gains will enable real state GDP growth to outpace job growth and remain in positive territory. S&P's projection of a deceleration in output growth from 2.4% in 2024 to 1.3% in 2025 would place the state slightly below its average for the post-Cold War period, but considerably above the 0.3% annual pace it has managed over the last two decades. Together, information and financial activities are projected to account for more than half the state's GDP growth in 2025 while manufacturing along with transportation, trade and utilities, will make up nearly another third of the total.

Conclusion

Fortunately, the devastation left by Covid—both human and economic—is in the past, but so too is the heady rebound that marked the return to pre-pandemic levels of economic activity. The path ahead appears relatively unobstructed though the going may be a bit slower. For the world that means steady, albeit slightly below average output growth. For the U.S., too, output growth will be average to below average, but job growth will almost certainly fall short of the longer-term trend. For Connecticut, 2025 may bring slower job and GDP growth than we saw over the past few years. But for the Nutmeg State, nearly any measure of real GDP growth is positive news.■

General Drift Indicators are composite measures of the four-quarter change in three coincident (Connecticut Manufacturing Production Index, nonfarm employment, and real personal income) and three leading (housing permits, manufacturing average weekly hours, and initial unemployment claims) economic variables, and are indexed so 2007 = 100.

The Philadelphia Fed's Coincident Index summarizes current economic condition by using four coincident variables: nonfarm payroll employment, average hours worked in manufacturing, the unemployment rate, and wage and salary disbursements deflated by the consumer price index (U.S. city average).

Total nonfarm employment increased over the year.

Source: CT DOL Research Office Analysis of HWOL Data Series
The Conference Board Help Wanted OnLine Data Series (HWOL) measures the number of new, first-time online jobs and jobs reposted from the previous month for over 16,000 Internet job boards, corporate boards and smaller job sites that serve niche markets and smaller geographic areas. The data can be used as a real-time measure of labor demand. For more information go to https://www1.ctdol.state.ct.us/lmi/hwol.asp.

NOTE: More industry detail data is available for the State and its nine labor market areas at: http://www.ctdol.state.ct.us/lmi/202/covered.htm. The data published there differ from the data in the preceding tables in that they are developed from a near-universe count of Connecticut employment covered by the unemployment insurance (UI) program, while the data here is sample-based. The data drawn from the UI program does not contain estimates of employment not covered by unemployment insurance, and is lagged several months behind the current employment estimates presented here.

now called Torrington-Northwest LMA. Five towns which are part of the Springfield, MA area are published as the Enfield LMA. The towns of Eastford and Hampton and other towns in the northeast are now called Danielson-Northeast LMA.

LABOR FORCE CONCEPTS

The civilian labor force comprises all state residents age 16 years and older classified as employed or unemployed in accordance with criteria described below. Excluded are members of the military and persons in institutions (correctional and mental health, for example).

2.2

The employed are all persons who did any work as paid employees or in their own business during the survey week, or who have worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, strike or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs. The unemployed are all persons who did not work, but were available for work during the survey week (except for temporary illness) and made specific efforts to find a job in the prior four weeks. Persons waiting to be recalled to a job from which they had been laid off need not be looking for work to be classified as unemployed.

With the exception of those persons temporarily absent from a job or waiting to be recalled to one, persons with no job and who are not actively looking for one are counted as "not in the labor force".

Over the course of a year, the size of the labor force and the levels of employment undergo fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays and the opening and closing of schools. Because these seasonal events follow a regular pattern each year, their influence on statistical trends can be eliminated by adjusting the monthly statistics. **Seasonal Adjustment** makes it easier to observe cyclical and other nonseasonal developments.

BUSINESS STARTS AND TERMINATIONS

Registrations and terminations of business entities as recorded with the U.S. Census Bureau and the Connecticut Department of Labor (DOL) are an indication of new business formation and activity. DOL business starts include new employers which have become liable for unemployment insurance taxes during the quarter, as well as new establishments opened by existing employers. DOL business terminations are those accounts discontinued due to inactivity (no employees) or business closure, and accounts for individual business establishments that are closed by still active employers. The Census's business formations include limited liability companies, limited liability partnerships, and foreign-owned (out-of-state) and domestic-owned (in-state) corporations.

CONSUMER PRICE INDEX

The Consumer Price Index (CPI), computed and published by the U.S. Bureau of Labor Statistics, is a measure of the average change in prices over time in a fixed market basket of goods and services. It is based on prices of food, clothing, shelter, fuels, transportation fares, charges for doctors' and dentists' services, drugs and other goods and services that people buy for their day-to-day living. The Northeast region is comprised of the New England states, New York, New Jersey and Pennsylvania.

EMPLOYMENT COST INDEX

The Employment Cost Index (ECI) covers both wages and salaries and employer costs for employee benefits for all occupations and establishments in both the private nonfarm sector and state and local government. The ECI measures employers' labor costs free from the influences of employment shifts among industries and occupations. The base period for all data is December 2005 when the ECI is 100.

Indian Gaming Payments are amounts received by the State as a result of the slot compact with the two Federally recognized tribes in Connecticut, which calls for 25 percent of net slot receipts to be remitted to the State. Indian Gaming Slots are the total net revenues from slot machines only received by the two Federally recognized Indian tribes.

HOURS AND EARNINGS ESTIMATES

Production worker earnings and hours estimates include full- and part-time employees working within manufacturing industries. Hours worked and earnings data are computed based on payroll figures for the week including the 12th of the month. Average hourly earnings are affected by such factors as premium pay for overtime and shift differential as well as changes in basic hourly and incentive rates of pay. Average weekly earnings are the product of weekly hours worked and hourly earnings. These data are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

INITIAL CLAIMS

Average weekly initial claims are calculated by dividing the total number of new claims for unemployment insurance received in the month by the number of weeks in the month. A minor change in methodology took effect with data published in the March 1997 issue of the DIGEST. Data have been revised back to January 1980.

INSURED UNEMPLOYMENT RATE

Primarily a measure of unemployment insurance program activity, the insured unemployment rate is the 13-week average of the number of people claiming unemployment benefits divided by the number of workers covered by the unemployment insurance system.

LABOR FORCE ESTIMATES

Labor force estimates are a measure of the work status of people who live in Connecticut. Prepared under the direction of the U.S. Bureau of Labor Statistics, the statewide estimates are the product of a signal-plus noise model, which uses results from the Current Population Survey (CPS), a monthly survey of Connecticut households, counts of claimants for unemployment benefits, and establishment employment estimates. The 2015 LAUS Redesign includes improved timeseries models for the census divisions, states, select substate areas, and the balances of those states; an improved real-time benchmarking procedure to the national Current Population Survey (CPS) estimates; an improved smoothed seasonal adjustment procedure; and improved treatment of outliers. Non-modeled area estimation improvements include: updated Dynamic Residency Ratios (DRR); more accurate estimates for all-other employment; more accurate estimation of agricultural employment; and improved estimation of non-covered agricultural unemployment. Handbook estimation is now done at the city/town level instead of at the Labor Market Area (LMA) level in Connecticut, which better reflects local conditions. The Redesign also introduces estimation inputs from the American Community Survey (ACS) to replace inputs that were previously obtained from the decennial census long-form survey. Labor force data, reflecting persons employed by place of residence, are not directly comparable to the place-of-work industry employment reflecting persons employed by place of residence, are not directly comparable to the place-of-work industry employment series. In the labor force estimates, workers involved in labor disputes are counted as employed. The labor force data also includes agricultural workers, unpaid family workers, domestics and the self-employed. Because of these conceptual differences, total labor force employment is almost always different from nonfarm wage and salary employment.

LABOR MARKET AREAS

All Labor Market Areas (LMAs) in Connecticut except three are federally-designated areas for developing labor statistics. For the sake of simplicity, the federal Bridgeport-Stamford-Norwalk NECTA is referred to in Connecticut DOL publications as the Bridgeport-Stamford LMA, and the Hartford-West Hartford-East Hartford NECTA is the Hartford LMA. The northwest part of the state is now called Torrington-Northwest LMA. Five towns which are part of the Springfield, MA area are published as the Enfield LMA. The towns of Eastford and Hampton and other towns in the northeast are now called Danielson-Northeast LMA. Industry employment and labor force data estimates contained in Connecticut Department of Labor publications are prepared following the same statistical procedures developed by the U.S. Department of Labor, Bureau of Labor Statistics, whether for federally designated or state-determined areas.

NONFARM EMPLOYMENT ESTIMATES

Nonfarm employment estimates are derived from a survey of businesses to measure jobs by industry. The estimates include all full- and part-time wage and salary employees who worked during or received pay for the pay period which includes the 12th of the month. Excluded from these estimates are proprietors, self-employed workers, private household employees and unpaid family workers. In some cases, due to space constraints, all industry estimates are not shown. These data are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

UI covered wages is the total amount paid to those employees who are covered under the Connecticut's Unemployment Insurance (UI) law for services performed during the quarter. The fluctuations in the 1992-93 period reflect the effect of the changes in the tax law and the massive restructuring in the state's economy.
