What the Connecticut Crash Data Repository Reveals

By Al Sylvestre, AICP, Research Analyst, CT Department of Labor

The Connecticut Department of Transportation (CDOT) Highway Safety Office, the UConn Transportation Safety Research Center, and the UConn Training and Technical Assistance (T2) Center are working to address road safety challenges informed by comprehensive data available through the Connecticut Crash Data Repository (CRD). Road design, driving behaviors, and traffic law enforcement changes on Connecticut streets since the coronavirus pandemic led to spikes in crashes with pedestrian fatalities followed by a decline in the two most recent years for which we have data as shown in the pedestrian fatalities since 2011 (Figure 1).

Notwithstanding the decline since 2022, pedestrian fatalities are nearly twice (180%) the 2011 baseline number. The CDR, a resource of complete, accurate, and uniform crash data, has helped land use planners, traffic and civil engineers, law enforcement, public safety officials, and policy makers understand and address Connecticut's long-standing road-safety challenges since 2011. The CDR facilitates complex queries of crash data recorded by state and local police. Data are compiled by the University of Connecticut Traffic Records Coordinating Committee (TRCC) along with transportation and public safety experts. TRCC engineers and University of

The Connecticut Economic Digest is published monthly by the Connecticut Department of Labor, Office of Research. Its purpose is to regularly provide users with a comprehensive source for the most current, up-to-date data available on the workforce and economy of the state, within perspectives of the region and nation.

The annual subscription is \$50. Send subscription requests to: **The Connecticut Economic Digest**, Connecticut Department of Labor, Office of Research, 200 Folly Brook Boulevard, Wethersfield, CT 06109-1114. Make checks payable to the Connecticut Department of Labor. Back issues are \$4 per copy. The Digest can be accessed free of charge from the DOL Web site. Articles from **The Connecticut Economic Digest** may be reprinted if the source is credited. Please send copies of the reprinted material to the Managing Editor. The views expressed by the authors are theirs alone and may not reflect those of the Connecticut Department of Labor.

This workforce product was funded in part by a grant awarded by the U.S. Department of Labor's Employment and Training Administration. Connecticut Transportation Institute information technology staff developed the CDR with funding from the Connecticut Department of Transportation. Before the CDR, Connecticut had separate repositories for motor vehicle crash data: one with CTDOT, the other with the Department of Public Safety (now the Department of Emergency Services and Public Protection or DESPP). In addition to two large-scale repositories, local police departments maintained numerous small-scale repositories throughout the state. Previous data repositories were not easily linked to roadway information, traffic volumes, or other pertinent data including weather, road conditions, and motorist behaviors among other data. As a single data repository, the CDR reduces duplication of effort among researchers.

What follows is a brief examination of the CDR data of which queries can be person-, crash-, or vehicle-centric. :

- **Fatal Crashes** whose data can take up to six months to report following crash investigation.
- **DUI Crashes** in which at least one driver is under the influence of medications or intoxicants.
- **Young Drivers** with at least one driver between the ages of 15 and 25.
- **Crashes involving Motorcycles** with at least one motorcycle involved.
- **Non-Motorist Crashes** involving either a bicyclist or a pedestrian.
- **Pedestrian-involved Crashes** where at least one person involved in the crash is a pedestrian.

· **Bicyclist-involved Crashes**

where at least one person involved in the crash is a bicyclist.

· **Work Zone Crashes** related to the presence of a work zone.

· **Crashes involving School Buses**

Buses in which at least one vehicle is a school bus.

· **Crashes involving ATVs** where at least one vehicle is an all-terrain vehicle (ATV).

· **Roadway Departure Crashes**

in which at least one operator drove off the roadway.

· **Intersections Crashes** that occurred at or near an intersection.

· **Railroad Crossing Crashes**

that occurred at a railroad grade crossing.

· **Crashes involving Transit Buses**

Buses in which at least one vehicle is a transit bus.

· **Federal Motor Carrier Safety Administration (FMCSA)¹**

Qualifying Crashes where at least one vehicle is a FMCSA qualifying vehicle with either:

1. a fatality,
2. an injury requiring transportation to a medical facility, or
3. disabling damage to one of the vehicles involved.

· **Crashes Involving Motor Coaches**

where at least one vehicle is a motor coach.

· **Crashes Involving at Least One Wrong Way Vehicle**

traveling on the wrong side or in the wrong direction.

- **Wrong Way Drivers Only** in which the driver and vehicle travel on the wrong side or in the wrong way with no other vehicles or people involved in the crashes.
- **Motorcycle Riders Only** involving motorcycles and riders only.
- **Crashes Involving Children Required to Use Car Seats** with at least one passenger involved who is a child required to be in a car seat until they are aged 7 and heavier than 60 pounds per state law.
- **Children Required to Use Car Seats Only** in which only children who are passengers that should be in a car seat

in the vehicles in which they were riding.

Crash Repository Analytics, Statistics, History (CRASH) queries regarding vehicle actions such as travel direction offer insights that traffic management professionals and public officials can apply to make travel safer for pedestrians. Left-turn crashes involving pedestrians account for nearly one-fifth (18%) of about 5,700 crashes as shown in Figure 2. These can be mitigated by curb extensions that reduce pedestrian crossing distances. The deployment of roundabouts whose efficacy is in slowing traffic so crashes result in less severe injuries to pedestrians, can even eliminate such crashes. Crash mitigation measures for straightaways and curves include road design

elements such as narrowing travel lanes, introducing curves with strategic parking on alternating sides of a straightaway, known in the trade as a chicane (Figure 3), and planting street trees to introduce a sense of enclosure that induces drivers to reduce their speeds. Regarding traffic lights and direction of travel, installing frames behind traffic lights facing east- and west-bound lanes reduces the effects of glare from the rising or setting sun thus making it easier for drivers and pedestrians to more clearly see signal lights.

Three-year CRASH data starting in 2022 summarized by crash, vehicle, and personal variables are available for display as charts filtered by time and date, fatalities and injuries, crash manner and location, road and weather conditions, events (such as collisions with other vehicles, pedestrians, animals, and moving or stationary objects), vehicle actions, demographics, crash severity, and several other factors that offer granular insight. Pedestrian crash conditions provide information about factors that may have influenced pedestrian crashes. The overwhelming majority of those crashes occurred when roads were dry and the weather was clear. Wet, snowy, and slushy road conditions, and roads under moving or still water were present in fewer than 16% of pedestrian crashes. Rain, clouds, snow, freezing rain, fog, drizzle, hail, and sleet combined were present in just over 16.5% of such crashes. One statistic that was close to expected was that 1,876 or 41.7% of pedestrian-involved crashes occurred in other than full daylight.

Drivers older than 70 accounted for 10% of those involved in pedestrian crashes, while 21% of

Figure 2

Vehicle Action	Count of Vehicles	% of Total Vehicles
Grand Total	5,657	100.0%
Straight Ahead	2727	48.2%
Turning Left	1,039	18.4%
Turning Right	455	8.0%
Backing	406	7.2%
Parked	349	6.2%
Entering Traffic Lane	78	1.4%
Passing/Overtaking a Vehicle	76	1.3%
Negotiating a Curve	73	1.3%
Slowing	66	1.2%
Stopped in Traffic	26	0.5%
Changing Lanes	25	0.4%
Leaving a Traffic Lane	23	0.4%
Wrong way or side	15	0.3%
Making a U-Turn	13	0.2%
Overtaking / Passing a Cyclist	3	0.1%
Traveling in Bike Lane	2	0.0%
Other	139	2.5%
Unknown	142	2.5%

such crashes were drivers under age 30. A third of pedestrian crashes involved female drivers while two-thirds involved male drivers. The statistics suggest that more education of young drivers could lead to fewer crashes involving pedestrians.

Data from the CDR's crash emphasis area show that about 4% of nearly 91,000 crashes resulted in serious injury or fatality with fatalities spiking in pandemic years 2020-2023. Fatalities reached their peak in 2021, a 67% increase over 2019, before declining in 2024. The ten-year timeline shows that most fatalities occurred on state and local roads while combined speed-related deaths on US and Interstate routes were fewer than those reported on local roads. Time-of-day crashes peaked at commuting times with highs recorded at 7:00 AM, 3:00 PM, and 4:00 PM while the fewest crashes occurred in the 4:00 AM to 6:00 AM pre-dawn hours.

Vehicle types, ages, and actions by crash severity (fatality, injury, property damage), and manner of collision show that of 92,096 vehicles in speeding crashes between early 2015 and the present, 65% were passenger cars, 20% were SUVs, while 2% were motorcycles. Unexpectedly, nearly half (47.7%) of speeding crashes occurred as the vehicle was on a straightaway while curves and turns were featured in only 30.5% of such crashes. Fatalities in speeding crashes were most numerous in 12-year-old vehicles (69), followed by 13-year-old vehicles (56), then eight-year-old vehicles (55). Property-damage-only crashes occurred most frequently among 12-year-old vehicles (3,500), followed by 11-year-old vehicles (3,400), then 10-year-old vehicles (3,300). About one-fifth (21.3%) of speeding crashes were front-to-

rear collisions. Angle crashes were a distant second at just under 11% and sideswipe collisions among vehicles going in the same direction were 5.6% of such crashes.

Of the 92,079 drivers involved in speeding crashes, nearly half (44.9%) suffered some type of injury while the fatality rate for this group is 1.1%. Of drivers committing the 10 most frequent actions contributing to speeding crashes, 31% failed to keep their lane while 13.1% ran off the road 12.9% were driving recklessly or in a distracted manner, and 12.2% followed too closely.

The wealth of information available on the Connecticut Crash Data Repository has enormous potential for helping planners, engineers, traffic authorities, and law enforcement understand the myriad causes of crashes. Knowledge gleaned from the data presents the opportunity

Figure 3: Chicane With Alternate Side Parking

to reduce the number of crashes through education, improved road design, and public policy changes. The UConn Transportation Safety Research Center, the CTDOT Highway Safety Office, and the UConn T2 Center are working separately and in concert to address road safety challenges through research, training, and testing. Road safety audits, training programs, classes, and seminars

for planners and local traffic authorities, and the application of street design and maintenance innovations are but a few of tools being developed and applied to make Connecticut's streets and roads safer for all their users that include people who walk, drive, use wheelchairs, ride bicycles and scooters, and use public transportation to connect with their communities. ■

General Drift Indicators are composite measures of the four-quarter change in three coincident (Connecticut Manufacturing Production Index, nonfarm employment, and real personal income) and three leading (housing permits, manufacturing average weekly hours, and initial unemployment claims) economic variables, and are indexed so 2007 = 100.

The **Philadelphia Fed's Coincident Index** summarizes current economic condition by using four coincident variables: nonfarm payroll employment, average hours worked in manufacturing, the unemployment rate, and wage and salary disbursements deflated by the consumer price index (U.S. city average).

Total nonfarm
employment increased

TOTAL NONFARM EMPLOYMENT					
PUTNAM-NORTHEAST	29,000	28,900	100	0.3	29,100
TORRINGTON-NORTHWEST	38,400	38,200	200	0.5	38,700

NOTE: More industry detail data is available for the State and its five metropolitan and two micropolitan areas at: <http://www.ctdol.state.ct.us/lmi/202/covered.htm>. The data published there differ from the data in the preceding tables in that they are developed from a near-universe count of Connecticut employment covered by the unemployment insurance (UI) program, while the data here is sample-based. The data drawn from the UI program does not contain estimates of employment not covered by unemployment insurance, and is lagged several months behind the current employment estimates presented here.

LABOR FORCE CONCEPTS

The **civilian labor force** comprises all state residents age 16 years and older classified as employed or unemployed in accordance with criteria described below. Excluded are members of the military and persons in institutions (correctional and mental health, for example).

The **employed** are all persons who did any work as paid employees or in their own business during the survey week, or who have worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, strike or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs. The **unemployed** are all persons who did not work, but were available for work during the survey week (except for temporary illness) and made specific efforts to find a job in the prior four weeks. Persons waiting to be recalled to a job from which they had been laid off need not be looking for work to be classified as unemployed.

For the sake of simplicity, the federal Hartford-West Hartford-East Hartford area is referred to in Connecticut DOL publications as the Hartford LMA. All Labor Market Areas (LMAs) in Connecticut except two are federally designated areas for developing labor statistics. The two nonfederal areas are Torrington-Northwest LMA and Putnam-Northeast LMA.

LABOR FORCE CONCEPTS (Continued)

The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

With the exception of those persons temporarily absent from a job or waiting to be recalled to one, persons with no job and who are not actively looking for one are counted as "not in the labor force".

Over the course of a year, the size of the labor force and the levels of employment undergo fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays and the opening and closing of schools. Because these seasonal events follow a regular pattern each year, their influence on statistical trends can be eliminated by adjusting the monthly statistics. **Seasonal Adjustment** makes it easier to observe cyclical and other nonseasonal developments.

BUSINESS STARTS AND TERMINATIONS

Registrations and terminations of business entities as recorded with the U.S. Census Bureau and the Connecticut Department of Labor (DOL) are an indication of new business formation and activity. DOL business starts include new employers which have become liable for unemployment insurance taxes during the quarter, as well as new establishments opened by existing employers. DOL business terminations are those accounts discontinued due to inactivity (no employees) or business closure, and accounts for individual business establishments that are closed by still active employers. The Census's business formations include limited liability companies, limited liability partnerships, and foreign-owned (out-of-state) and domestic-owned (in-state) corporations.

CONSUMER PRICE INDEX

The Consumer Price Index (CPI), computed and published by the U.S. Bureau of Labor Statistics, is a measure of the average change in prices over time in a fixed market basket of goods and services. It is based on prices of food, clothing, shelter, fuels, transportation fares, charges for doctors' and dentists' services, drugs and other goods and services that people buy for their day-to-day living. The Northeast region is comprised of the New England states, New York, New Jersey and Pennsylvania.

EMPLOYMENT COST INDEX

The Employment Cost Index (ECI) covers both wages and salaries and employer costs for employee benefits for all occupations and establishments in both the private nonfarm sector and state and local government. The ECI measures employers' labor costs free from the influences of employment shifts among industries and occupations. The base period for all data is December 2005 when the ECI is 100.

GAMING DATA

Indian Gaming Payments are amounts received by the State as a result of the slot compact with the two Federally recognized tribes in Connecticut, which calls for 25 percent of net slot receipts to be remitted to the State. Indian Gaming Slots are the total net revenues from slot machines only received by the two Federally recognized Indian tribes.

HOURS AND EARNINGS ESTIMATES

Production worker earnings and hours estimates include full- and part-time employees working within manufacturing industries. Hours worked and earnings data are computed based on payroll figures for the week including the 12th of the month. Average hourly earnings are affected by such factors as premium pay for overtime and shift differential as well as changes in basic hourly and incentive rates of pay. Average weekly earnings are the product of weekly hours worked and hourly earnings. These data are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

INITIAL CLAIMS

Average weekly initial claims are calculated by dividing the total number of new claims for unemployment insurance received in the month by the number of weeks in the month. A minor change in methodology took effect with data published in the March 1997 issue of the DIGEST. Data have been revised back to January 1980.

INSURED UNEMPLOYMENT RATE

Primarily a measure of unemployment insurance program activity, the insured unemployment rate is the 13-week average of the number of people claiming unemployment benefits divided by the number of workers covered by the unemployment insurance system.

LABOR FORCE ESTIMATES

Labor force estimates are a measure of the work status of people who live in Connecticut. Prepared under the direction of the U.S. Bureau of Labor Statistics, the statewide estimates are the product of a signal-plus noise model, which uses results from the Current Population Survey (CPS), a monthly survey of Connecticut households, counts of claimants for unemployment benefits, and establishment employment estimates. The 2015 LAUS Redesign includes improved time-series models for the census divisions, states, select substate areas, and the balances of those states; an improved real-time benchmarking procedure to the national Current Population Survey (CPS) estimates; an improved smoothed seasonal adjustment procedure; and improved treatment of outliers. Non-modeled area estimation improvements include: updated Dynamic Residency Ratios (DRR); more accurate estimates for all-other employment; more accurate estimation of agricultural employment; and improved estimation of non-covered agricultural unemployment. Handbook estimation is now done at the city/town level instead of at the Labor Market Area (LMA) level in Connecticut, which better reflects local conditions. The Redesign also introduces estimation inputs from the American Community Survey (ACS) to replace inputs that were previously obtained from the decennial census long-form survey. Labor force data, reflecting persons employed by place of residence, are not directly comparable to the place-of-work industry employment series. In the labor force estimates, workers involved in labor disputes are counted as employed. The labor force data also includes agricultural workers, unpaid family workers, domestics and the self-employed. Because of these conceptual differences, total labor force employment is almost always different from nonfarm wage and salary employment.

LABOR MARKET AREAS

All Labor Market Areas (LMAs) in Connecticut except two are federally-designated areas for developing labor statistics. For the sake of simplicity, the federal Hartford-West Hartford-East Hartford area is referred to in Connecticut DOL publications as the Hartford LMA. The two nonfederal areas are Torrington-Northwest LMA and Putnam-Northeast LMA. Industry employment and labor force data estimates contained in Connecticut Department of Labor publications are prepared following the same statistical procedures developed by the U.S. Department of Labor, Bureau of Labor Statistics, whether for federally designated or state-determined areas.

NONFARM EMPLOYMENT ESTIMATES

Nonfarm employment estimates are derived from a survey of businesses to measure *jobs* by industry. The estimates include all full- and part-time wage and salary employees who worked during or received pay for the pay period which includes the 12th of the month. Excluded from these estimates are proprietors, self-employed workers, private household employees and unpaid family workers. In some cases, due to space constraints, all industry estimates are not shown. These data are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

UI COVERED WAGES

UI covered wages is the total amount paid to those employees who are covered under the Connecticut's Unemployment Insurance (UI) law for services performed during the quarter. The fluctuations in the 1992-93 period reflect the effect of the changes in the tax law and the massive restructuring in the state's economy.
