## Housing Sector Remained Strong in 1999

By Kolie Sun Chang, Senior Research Analyst

The number of State housing permits issued in 1999 was just under the 1998 level, which was the highest number of permits authorized in the last decade. As the lead agency in housing issues, the Department of Economic and Community Development keeps track of monthly new residential permits and other housing related matters. The following analysis will describe different aspects of the Connecticut housing sector.

### Housing Trend Analysis

In the mid 1980s, the real estate sector was booming in Connecticut and in one year alone the State issued over 30,000 new residential permits. Permit activities then declined each year until 1991. The housing industry was hit the hardest in the early 1990s when the economic recession caused corporate layoffs, high unemployment, and low consumer

confidence. Newly authorized permits plunged to 7,700 in 1991, but have climbed back to a peak of over 11,000 units in 1998, the highest level of permits issued in the past decade. Permit activity was sustained in 1999 at 10,637 units.

Comparing 1990 to 1999, new housing permits authorized increased almost 32 percent at the State level. Among the counties, Tolland, Middlesex and Fairfield Counties outpaced the State level with percentage increases of 121 percent, 116 percent and 44 percent respectively during the same period. Windham County was the only county to post a decrease, from 422 units to 392 units.

### Total Housing Production and Demolitions

According to the latest release from the Bureau of the Census, Connecticut issued 10,637 new

**The Connecticut Economic Digest** is published monthly by the Connecticut Department of Labor, Office of Research and the Connecticut Department of Economic and Community Development, Public Affairs and Strategic Planning Division. Its purpose is to regularly provide users with a comprehensive source for the most current, up-to-date data available on the workforce and economy of the state, within perspectives of the region and nation.

The views expressed by authors are theirs alone and do not necessarily reflect those of the Departments of Labor or Economic and Community Development.

permits in 1999, the second highest in the decade. In terms of single family permits issued, there were 9,249 units in 1999, the highest volume since 1990. Construction of duplex and 3 or more unit housing has decreased over the years. Statewide multi-units were down 39 percent from 2,284 units to 1,234 units. Fairfield County had the largest percentage increase of single family units, a 133 percent increase, from 753 units authorized in 1990 to 1,758 units in 1999. Windham County had the smallest increase of six percent in single family housing permits authorized during the same time.

DECD recently conducted its annual survey of Connecticut's municipalities to collect demolition information. This year's effort yielded an 85 percent response rate. The City of Hartford had the largest volume of demolitions, 288, followed by Bridgeport with 274, Waterbury with 146, and New Britain with 108. (The City of New Haven did not reply to our survey.) This vigorous demolition activity will translate into more new permits authorized and more new buildings constructed in the long term.

### Construction Value and Home Sales Prices

The cost of construction has been on the rise over the past decade, especially for single-family units. The average construction cost for a single-family unit was \$148,435 in 1999, a 36.4 percent increase from \$108,849 in 1990.

The median sales price of single family homes was \$136,000 in 1996 while the average price was \$194,593. In 1998, the median price of new homes was \$145,000, representing an increase of 5.1 percent from 1996, while the average price increased by 10.6 percent to \$215,173. The increasing divergence between the median and average sales prices is a sign that more very expensive

homes are being sold, boosting the average. Home sales also jumped significantly, by 27.8 percent, from 1996 to 1998 due to the robust economy, including strong job and income growth, low mortgage rates and near-record high consumer confidence.

### Rental Rates by Bedrooms

Regional Financial Associates' (RFA) estimates that 61 percent of Connecticut's housing stock was owner occupied at the beginning of the last decade, and homeownership increased slightly to 62.3 percent by the year 2000. Conversely, the share of rental units declined from 31.8 percent in 1990 to 27 percent in 2000. The vacant unit share increased from seven percent to 10.6 percent during the same period.

The statewide average rent for a 3-bedroom unit went from \$712 in 1990 to \$801 in 2000, a 12.5 percent increase over the decade. Currently, Fairfield County leads all counties with the highest average rent of \$977, compared to the lowest rent in Windham County of \$631 for a 3-bedroom unit. New London County showed the highest rental rate growth from \$620 monthly to \$748, followed by Hartford County, Middlesex County and Litchfield County. New Haven County showed the smallest growth of 5.4 percent. The rental data suggests that higher rents may be a factor behind the aforementioned increase in homeownership.

### Conclusion

In conclusion, permit growth was sustained. New housing authorizations increased. Seven out of the eight counties showed a production increase over the decade. A large number of city demolitions suggests that revitalization is occurring. Homeownership continued to grow. All signs point to a strong housing sector. ■

# A Closer Look at Worker Displacement

By Joseph Slepski, Research Analyst

**W**hy do workers lose their jobs? This is a seemingly simple question with seemingly straightforward answers, but not so fast... Job loss can result from a variety of personal and outside factors. Personal factors include things like skill competencies, work ethic, attitude, etc. Outside factors can include business downsizing and restructuring. Why do these cutbacks occur? To answer that question, the entire economic picture for an area must be reviewed. For this discussion, let's look at the State of Connecticut.

## 40,600 Jobless

With a labor force approaching 1.7 million people, Connecticut has recovered quite nicely from the recession of the early nineties. Current employment is at 1,694,600, which is the highest level ever. The unemployment rate is 2.4 percent, which is near a record low. While these numbers show that Connecticut is doing very well, there are still 40,600 people who don't have a job. In this economic environment, why do people lose their jobs?

## HOUSING UPDATE

### May Permits Up 11.9 Percent from April

**C**ommissioner James F. Abromaitis of the Connecticut Department of Economic and Community Development announced that Connecticut communities authorized 863 new housing units in May 2000, a 2.6 percent decrease compared to May of 1999 when 886 units were authorized.

The Department further indicated that the 863 units permitted in May 2000 represent an increase of 11.9 percent from the 771 units permitted in April

2000. The year-to-date permits are down 11.2 percent, from 4,284 through May 1999, to 3,804 through May 2000.

New Haven County documented the largest number of new, authorized units in May with 172. Hartford County followed with 162 units and Fairfield County had 160 units. Danbury led all Connecticut communities with 32 units, followed by Southington with 27, and Avon and North Haven tied at 16. ■

*For more information on housing permits, see tables on pages 21-22.*

## Industry Clusters

### Cities Championed

**O**n May 16, 2000, Governor John G. Rowland announced a \$5 million statewide strategy to promote inner-city revitalization through business development. The strategy is the outcome of the Connecticut Inner City Business Strategy Initiative, a year-long partnership of the Governor's Council on Competitiveness and Technology, the Department of Economic and Community Development (DECD), and the Initiative for a Competitive Inner City (ICIC). Through this initiative, local leaders in Hartford, Bridgeport, New Britain, New Haven, and Waterbury developed market-based strategies to increase the income, wealth, and employment opportunities for inner-city residents by promoting business development.

Over 200 corporate, government, and nonprofit leaders in the five target cities have been actively involved with guidance from the Initiative for a Competitive Inner City (ICIC), a non-profit organization founded by Harvard Business School Professor Michael E. Porter. Leadership teams in each city developed strategic action plans based on a careful assessment of their inner city.

Each city's efforts were led by a City Champion — a local CEO who led the city's Advisory Board, composed of 20-25 business, government, and community leaders who provided feedback on research findings, oversaw strategy development, and led the transition to implementation. ■

*Copies of each city's complete report can be downloaded at [www.state.ct.us/eecd/clusters](http://www.state.ct.us/eecd/clusters) or [www.cerc.com/clusters.html](http://www.cerc.com/clusters.html)*

## Shifts in the Labor Market

As mentioned earlier, payrolls are at record levels. The dynamics of the market, however, have changed. At the end of the eighties, more than a fifth of all workers were employed in factories; currently, manufacturing comprises just sixteen percent of total employment. In terms of numbers, employment levels in factories have declined by nearly 80,000 since 1990. In Connecticut no other industry was hit by the recession as hard. In contrast, employment in the transportation, communications and utilities sector has increased by nearly ten percent during the last ten years, while employment levels in the service sector have grown by a whopping twenty-seven percent.

## Worker Displacement

According to a study conducted by Steven Hipple of the United States Department of Labor, Bureau of Labor Statistics and published in the July 1999 *Monthly Labor Review*, worker displacement rates in manufacturing industries in 1995-96 were running at 5.1 percent nationally, which was by far the highest of all industries. On an occupational level, blue-collar workers had a displacement rate of 3.5 percent as opposed to a 2.9 percent displacement rate among workers in white-collar jobs. Mr. Hipple's study reported the following reasons for job loss: fifty percent of those who lost their jobs cited plant or company closures, thirty percent had their position or shift abolished, and the remaining twenty percent lost their jobs due to insufficient work.

These trends appear to be true in Connecticut also. While overall employment has gone up by 25,800 in the last year, a closer look shows that 4,600 jobs

were lost among the manufacturing industries. Various manufacturers in Connecticut have eliminated jobs due to the previously mentioned reasons, as well as for other reasons including unprofitability, declining sales, fewer contracts and increased global competition.

Mr. Hipple's report also offers some positive comments on what happens to workers who lose their jobs during a period of low unemployment. He notes that having robust national and local economies does provide relief to workers who find themselves out of a job. According to Mr. Hipple's study, the median period of joblessness was 7.6

---

***"In today's economy, those who formerly worked in factories will find a greater number of jobs available in the trade and the service industries, which are the fastest growing."***

---

weeks. The rate of reemployment ranged from over eighty percent for those without a high school diploma to ninety-three percent for those with a college degree. The new jobs had a slightly lower (four percent) rate of pay, though.

Those who have experienced joblessness may often switch industries in an effort to regain employment. In today's economy, those who formerly worked in factories will find a greater number of jobs available in the trade and the service industries, which are the fastest growing. Indeed, many employers are having great difficulty filling existing positions in these industries.

Citing the previously mentioned study, it should be noted that over half of the factory workers who lost their jobs had been in their position for under three years. But even short-term employees tend to have higher earnings in manufacturing jobs than do many workers in trade and service industries. Some workers will remain unemployed trying to find a job with a salary that better compares to their factory income. There are indications that many individuals who are taking early retirement offers from companies downsizing for economic reasons are looking for other types of work. Receiving retirement income gives these people added flexibility for accepting another line of work. This factor should make the transition to a different industry somewhat less difficult than it might be for those who need to fully replace their past salary.

## Conclusion

While the information mentioned in this narrative does not give all of the answers to all of the questions about job loss, it does provide a few interesting facts. Connecticut residents have lost and will continue to lose jobs in good times and in bad. Presently, however, the statewide economy is strong enough to absorb these cutbacks and provide new opportunities for those who have been displaced. ■

The distance from peak to trough, indicated by the shaded areas, measures the duration of an employment cycle recession. The vertical scale in both charts is an index with 1987=100.

## The Connecticut Economy's Endless Summer?

**T**he Connecticut economy continues to ride the longest wave (expansion) in the post-WWII period. Optimists (the new-economy folk) feel like the wave can continue forever. Realists (the business-cycle-still-lives folk) recognize that waves do not last forever and that the end will come in its own good time. The Connecticut coincident index reached a new peak with the release of (preliminary) April 2000 data. The Connecticut leading employment index, however, continues to loll around the same neighborhood since mid-1998. Until further notice, surfs up, enjoy the ride.

The coincident index, a gauge of current employment activity, surpassed the February 1989 peak of the last expansion in January, March, and April 2000. Nonfarm jobs and total employment exceed their peak values in the late 1980s. Moreover, the unemployment rate remains at 2.3 percent and the insured unemployment rate fell to just under 1.8 percent, its lowest level since the go-go days of the late 1980s.

The leading index, a barometer of future employment activity, continues to move within a range first established in late 1996, although it now operates near the upper region of this recent range. It still is the case, however, that the leading index has yet to show any movement, either up or down.

The major risk to the continuation of the current expansion remains the growth of the labor force. While the labor force showed some signs of new liveliness, its growth of only 1 percent over the last year fell short of the growth of jobs and employment. As a result, we now see important upward pressure on wages. Moreover, the inflation rate in Connecticut was recently reported at its highest level during the 1990s. (See "Prices, 1980 Style" in *The Connecticut Economy: A University of Connecticut Quarterly Review*, Summer 2000.) Much of this higher inflation rate, however, associates with higher home and energy costs. Moreover, as reported in this column last month, the more frequent news reports, both nationally and locally, of unions striking, or

threatening to strike, provides another clear sign that wage and price pressures are building.

In summary, the coincident employment index rose from 96.6 in April 1999 to 103.2 in April 2000. All four components of the index point in a positive direction on a year-over-year basis with higher nonfarm employment, higher total employment, a lower total unemployment rate, and a lower insured unemployment rate.

The leading employment index rose from 90.0 in April 1999 to 90.5 in April 2000. Three index components sent positive signals on a year-over-year basis with a lower short-duration (less than 15 weeks) unemployment rate, lower initial claims for unemployment insurance, and a higher average workweek of manufacturing production workers. Two components sent negative signals on a year-over-year basis with lower total housing permits and lower Hartford help wanted advertising. ■

## **BUSINESS STARTS AND TERMINATIONS**

DOL newly registered employers are those businesses newly registered with the Labor Department's unemployment insurance program (including reopened accounts) during the month. DOL discontinued employers are those accounts that are terminated due to inactivity (no employees) or business closure. Registrations and terminations of business entities as recorded with the Secretary of the State are an indication of new business formation and activity. These registrations include limited liability companies, limited liability partnerships, and foreign-owned (out-of-state) and domestic-owned (in-state) corporations.

## **CONSUMER PRICE INDEX**

The Consumer Price Index (CPI), computed and published by the U.S. Bureau of Labor Statistics, is a measure of the average change in prices over time in a fixed market basket of goods and services. It is based on prices of food, clothing, shelter, fuels, transportation fares, charges for doctors' and dentists' services, drugs and other goods and services that people buy for their day-to-day living. The Northeast region is comprised of the New England states, New York, New Jersey and Pennsylvania. *There is no separate consumer price index for Connecticut or any area within the state.*

## **EMPLOYMENT COST INDEX**

The Employment Cost Index (ECI) covers both wages and salaries and employer costs for employee benefits for all occupations and establishments in both the private nonfarm sector and state and local government. The ECI measures employers' labor costs free from the influences of employment shifts among industries and occupations. The base period for all data is June 1989 when the ECI is 100.

## **HOURS AND EARNINGS ESTIMATES**

Production worker earnings and hours estimates include full- and part-time employees working within manufacturing industries. Hours worked and earnings data are computed based on payroll figures for the week including the 12th of the month. Average hourly earnings are affected by such factors as premium pay for overtime and shift differential as well as changes in basic hourly and incentive rates of pay. Average weekly earnings are the product of weekly hours worked and hourly earnings.

## **INDIAN GAMING DATA**

Indian Gaming Payments are amounts received by the State as a result of the slot compact with the two Federally recognized tribes in Connecticut, which calls for 25 percent of net slot receipts to be remitted to the State. Indian Gaming Slots are the total net revenues from slot machines received by the two Federally recognized Indian tribes.

## **INITIAL CLAIMS**

Average weekly initial claims are calculated by dividing the total number of new claims for unemployment insurance received in the month by the number of weeks in the month. A minor change in methodology took effect with data published in the March 1997 issue of the DIGEST. Data have been revised back to January 1980.

## **INSURED UNEMPLOYMENT RATE**

Primarily a measure of unemployment insurance program activity, the insured unemployment rate is the 13-week average of the number of people claiming unemployment benefits divided by the number of workers covered by the unemployment insurance system.

## **LABOR FORCE ESTIMATES**

Labor force estimates are a measure of the work status of people who live in Connecticut. Prepared under the direction of the U.S. Bureau of Labor Statistics, the statewide estimates are the product of a multiple variable coefficient regression model, which uses results from the Current Population Survey (CPS), a monthly survey of Connecticut households, counts of claimants for unemployment benefits, and establishment employment estimates. Due to the small size of the sample taken in Connecticut, the CPS results are subject to significant sampling error and produce considerable month-to-month fluctuations in estimates derived from the sample. In general, the CPS estimates, at the 90 percent confidence level, have an error range of about 1.5 percentage points on a rate of 6.0 percent. An accepted method for calculating the error range for model estimates is currently not available. Labor force data, reflecting persons employed by place of residence, are not directly comparable to the place-of-work industry employment series. In the labor force estimates, workers involved in labor disputes are counted as employed. The labor force data also includes agricultural workers, unpaid family workers, domestics and the self-employed. Because of these conceptual differences, total labor force employment is almost always different from nonfarm wage and salary employment.

## **LABOR MARKET AREAS**

All Labor Market Areas in Connecticut except three are federally designated areas for developing labor statistics. Industry employment data for the Danielson, Lower River and Torrington Labor Market Areas are prepared exclusively by the Connecticut Department of Labor, following the same statistical procedures used to prepare estimates for the other Labor Market Areas, which are developed in cooperation with the U.S. Department of Labor, Bureau of Labor Statistics.

The Bureau of Labor Statistics has identified the five towns of Canaan, Kent, North Canaan, Salisbury and Sharon as a separate area for reporting labor force data. For the convenience of our data users, data for these towns are included in the Torrington Labor Market Area. For the same purpose, data for the town of Thompson, which is officially part of the Worcester Metropolitan Statistical Area, are included in the Danielson Labor Market Area. Also, data for Hopkinton and Westerly, Rhode Island are included in the New London Labor Market Area.

## **LEADING AND COINCIDENT EMPLOYMENT INDICES**

The *leading employment index* is a composite of five individual employment-related series -the average workweek of manufacturing production workers, Hartford help-wanted advertising, short-duration (less than 15 weeks) unemployment rate, initial claims for unemployment insurance and total housing permits. While not an employment-sector variable, housing permits are closely related to construction employment. The *coincident employment index* is a composite indicator of four individual employment-related series -the total unemployment rate, nonfarm employment (employer survey), total employment (household survey) and the insured unemployment rate. All data are seasonally adjusted and come from the Connecticut Labor Department and from the Federal Reserve Bank of Boston.

## **NONFARM EMPLOYMENT ESTIMATES**

Nonfarm employment estimates are derived from a survey of businesses to measure *jobs* by industry. The estimates include all full- and part-time wage and salary employees who worked during or received pay for the pay period which includes the 12th of the month. Excluded from these estimates are proprietors, self-employed workers, private household employees and unpaid family workers. In some cases, due to space constraints, all industry estimates are not shown. Call (860) 263-6275 for a more comprehensive breakout of nonfarm employment estimates.

## **UI COVERED WAGES**

UI covered wages is the total amount paid to those employees who are covered under the Connecticut's Unemployment Insurance (UI) law for services performed during the quarter. The fluctuations in the 1992-93 period reflect the effect of the changes in the tax law and the massive restructuring in the state's economy.
